TITLE: Operation of a turbine stage with relatively long blades under off-rating conditions

SOURCE: IVUZ. Energetika, no. 5, 1963, 55-62

TOPIC TAGS: gas turbine, long turbine blade, off-rating condition

ABSTRACT: A theoretical study is offered of an intermediate turbine with long blading under off-rating conditions when the total radial parameters before the nozzle are variable. With a number of important assumptions concerning the turbine path, axial symmetry of flow, iso-entropy-type of process, similar variation of parameters before and after the stage, etc., fundamental equations are set up and solved. In solving radial-equilibrium equations, special attention is paid

Card 1/2

L 17303-63

to variation of parameters before the nozzle and behind the blading. General solutions are illustrated by a numerical example which gives hub-to-tip gas velocities and pressure, as well as axial velocity and radial acceleration. Orig. art. has: 4 figures and 22 formulas.

TITLE: Effect of the form of the bounding surfaces of the flow through section on the working process of a turbine stage

SOURCE: IVUZ. Energetika, no. 3, 1966, 62-68

TOPIC TAGS: hydrodynamic theory, turbine stage, turbine design

ABSTRACT: One of the main factors determining the end losses in a turbine is the amount of overlap between stages. The present article gives the results of an investigation of the effect of the overlap at the point of the blades on the overall characteristics and on the structure of the three dimensional flow in the stages of a marine turbine. Experiments were carried out with various geometries of the system; the results are shown in tabular and graphic form. In general, the following conclusions were drawn: 1) the positive overlap before

Card 1/2

UDC: 621.165

L 46175-66

ACC NR: AP6021934

the turbine jet unit and the gap between the overlap and the entry edges of the blades have a rather strong effect on the efficiency and other overall characteristics of the turbine stages. It is shown that losses due to overlap can exceed losses due to sudden expansion of the flow; 2) the fact that the observed effect of positive overlap was greater than in previous investigations is attributed to the presence of a conical outer bounding surface and to the absence of twist in the working blades; 3) the effect of the overlap and of the gap increases with an increase in the relative length of the blades; 4) the discharge coefficient decreases with an increase in the overlap and a decrease in the gap; this is explained by an increase of the losses in the jet nozzle unit; 5) a change in the axial gap has practically no effect on the nature of the effect of the overlap. Orig. art. has: 5 figures and 1 table.

TITLE: Properties of iron-aluminum alloys and smelting methods

SOURCE: AN SSSR. Izvestiya. Metally, no. 5, 1965, 121-123

TOPIC TAGS: iron aluminum alloy, aluminum containing alloy, induction furnace, smelting furnace, vacuum furnace, iron containing alloy, MAGNETIC PROPERTY, OXYGEN, ALLOY COMPOSITION

ABSTRACT: The effect of the smelting method on the composition of iron-aluminum alloys was investigated. Fe-Al alloys containing 14-17% Al and small concentrations of C, S, O₂, N₂, Si, Mn, and P were smelted in open induction, vacuum induction, and induction furnaces in hydrogen, helium, and argon atmospheres. The conditions of smelting operation in terms of temperature, duration and cooling rate varied widely. Smelting in the open induction furnace yielded alloys with a 0.002-0.009% oxygen content. Substantially smaller oxygen content (10-40%) was found in alloys smelted in the vacuum induction furnace. Induction furnace smelting in helium, argon, and hydrogen atmospheres produced the highest alloy purity (alloys with the lowest content of S, N₂, and O₂). It was found that thermomechanical working exerted a profound effect on the magnetic properties of the alloys.

TITLE: Singular double integrals extended to an infinite two-dimensional region

SOURCE: AN GruzSSR. Soobshcheniya, v. 37, no: 3, 1965, 513-520

TOPIC TAGS: double integral, singular integral, Cauchy problem

ABSTRACT: The article considers the question of expressing the function $f(x,y) \in L(-\infty, \infty; -\infty, \infty)$ as the limit of a singular double integral extended to an infinite two-dimensional region. The function $\phi_{\gamma,\delta}(t-x, \tau-y)$ ($\gamma > 0, \delta > 0$), summable on $R = (-\infty < t < \infty; -\infty < \tau < \infty)$ for any x and y , $-\infty < x < \infty$, $-\infty < y < \infty$, is said to be the kernel if

$$\lim_{(\gamma,\delta) \rightarrow 0} \int_a^b \int_c^d \phi_{\gamma,\delta}(t-x, \tau-y) dt d\tau = 1$$

for any a, b, c , and d , where $a < x < b$; $c < y < d$. The expression $(\gamma, \delta) \rightarrow 0$ denotes the approach of γ and δ to zero for $\frac{\gamma}{\delta} \leq \frac{\delta}{\gamma} \leq \lambda$, where λ is a given number ≥ 1 . An integral of the form

Card 1/3

L 24076-66 -

ACC NR: AP6014981

$$U(\gamma; x, y, \gamma, \delta) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \Phi_{\gamma, \delta}(t-x, \tau-y) f(t, \tau) dt d\tau,$$

where $\Phi_{\gamma, \delta}(t-x, \tau-y)$ is the kernel, is said to be a singular integral. The author outlines the proof of the following theorem: If the kernel $\Phi_{\gamma, \delta}(t-x, \tau-y)$ possesses the property

$$\Phi_{\gamma, \delta}(t-x, \tau-y) = \begin{cases} O\left(\frac{1}{\gamma\delta}\right), & |t-x| < \gamma, \quad |\tau-y| < \delta, \\ O\left[\frac{\gamma\delta}{(t-x)^2(\tau-y)^2}\right], & |t-x| > \gamma, \quad |\tau-y| > \delta, \\ O\left[\frac{\gamma}{(t-x)^2\delta}\right], & |t-x| > \gamma, \quad |\tau-y| < \delta, \\ O\left[\frac{\delta}{\gamma(\tau-y)^2}\right], & |t-x| < \gamma, \quad |\tau-y| > \delta, \end{cases}$$

$\frac{2}{\lambda} < \frac{\gamma}{\delta} < \lambda, \quad \frac{1}{\lambda} < \frac{\gamma}{\delta} < \lambda,$

then for any summable function $f(t, \tau)$ the equality

$$\lim_{(\gamma, \delta) \rightarrow 0} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \Phi_{\gamma, \delta}(t-x, \tau-y) f(t, \tau) dt d\tau = f(x, y)$$

Card 2/3

L 24076-66

ACC NR: AP6014981

holds for almost all $(x, y) \in R$. The proof is based on four lemmas. The following examples are given: 1) a Fourier integral $C\lambda$ -summable at the point (x, y) to the value S ; 2) a Fourier-Lebesgue integral summable at the point (x, y) to the value S by Cauchy's method; 3) a Fourier-Lebesgue integral summable at the point (x, y) to the value S by Weierstrass' method. 0

The following corollary is given: Let

$$f^*(x, y) = \begin{cases} f(x, y), & \text{if } (x, y) \in R_0 = [a, b; c, d], \\ 0, & \text{if } (x, y) \in CR_0; \end{cases}$$

then almost everywhere in R_0 the relation

$$\lim_{(\gamma, \delta) \rightarrow 0} \int_a^b \int_c^d \Phi_{\gamma, \delta}(t-x, \tau-y) f^*(t, \tau) dt d\tau = f^*(x, y) \quad \text{holds.}$$

TITLE : Effect of Moisture Content and Spontaneous Heating of Raw Cotton on Formation of Peel Attached to Fiber

ORIG. PUB. : Sots. s. Kh. Uzbekistana, 1957, No 9, 28-31

ABSTRACT : Peel attached to fiber (an undesirable inclusion in the yarn that lowers its quality) is the result of separation together with the fiber of portions of the outer layer of epidermis of cotton seed. Its content in the fibers depends, in particular, upon degree of maturity and storage conditions of the raw cotton. In order to determine the effect of storage conditions on quality of fiber and on the amount of peel attached to the fiber, special experiments have been conducted over a number of years at the Ferganskaya Experiment Station of Union-NIKHI. Samples of raw cotton were collected from different varieties from bolls located on different sympodia (of varying degree

ABSTRACT : of maturity), and were kept in moistened condition for 3, 5, 10, 15, 20 and 30 days at a temperature of 50-70°. Raw cotton stored under normal conditions served as control. Thereafter, the fiber was separated and its quality was tested. It was found that on the third day of storage, under conditions of spontaneous heating, the fiber acquires a cream coloration, and on the 10-15th day a dirty yellowish-grey color. After 15 days of storage strength of the fibers decreases sharply, which is associated with a shortening of the fibers. Cells of the upper layers of seed-epidermis become less strongly bound together and as a result the amount of peel attached to fiber increases. Fineness of fiber is not affected by storage. -- D. B. Vakhmistrov.

 Porazenie dziecięce (choroba Heine-Medina) a inne kliniczne postaci ostrego
 schorzenia mózgowia i rdzenia, notowane w Krakowie w latach 1945-1947 Infantile
 paralysis and other clinical forms of acute encephalitis and encephalomyelitis
 registered in Cracow in 1945-1947 Przegląd Lekarski, Cracow 1949, 5/12 (380-384)
 Graphs 3

Mass outbreaks of infantile paralysis were accompanied by cases of encephalitis and encephalomyelitis during 1945-1947, with a July peak in morbidity. While poliomyelitis was on the decrease during the three-year period, the incidence of a seasonal incidence of each of the three forms was noted. Of the total of 271 cases, 192 were diagnosed as poliomyelitis and 79 as encephalomyelitis and encephalitis. The two latter forms are considered as manifestations of poliomyelitis. This assumption is based on the coincidence of the outbreaks and the seasonal peak of the epidemics. The negative results of intracerebral inoculations of mice and rabbits with encephalitic material also support this theory. The author considers favourably the theory advocated by American investigators which regards the intestinal tract as the portal of entry of poliomyelitis virus.

TITLE: The Broaching of Outer Surfaces by Generating Broaches
PERIODICAL: Stanki i Instrument, 1960, No. 12, pp. 31-32

TEXT: The dizelestroitel'nyye zavod im. Kircva (Diesel Engine Plant im. Kirov) at B. Tokmak machines the nine surfaces of crankshaft bearing covers in one operation with the aid of a few tunnel-shaped generating broach. Formerly this required six operations. The authors call the employed method of progressive broaching the most effective of all mechanical machining operations. This method consists in the following: each tooth of the broach removes the full thickness of the allowance, cutting a strip of the surface being machined which is equal to the magnitude of feed per tooth. Since the teeth of such broaches cut the metal layer located under the casting skin, the wear of the broach teeth during

Figure 1:

Card 1/5

A004/A001

The Broaching of Outer Surfaces by Generating Broaches

progressive broaching is considerably lower than with ordinary broaching methods. Moreover, all teeth are worn to the same degree. The broach was made of individual sections which were combined in the stationary part of the device. To facilitate the mounting and setting of the broaches, the stationary part of the broaching device was made detachable as it is shown in Figure 2. To insure the right position of the broaches fixed in the upper part of the device relative to those in the lower part both halves of the device are set with the aid of two keys placed in the joining plane of the device. Figure 3

Figure 3:

Card 2/5

S/121/60/000/012/014/015
A004/A001

The Broaching of Outer Surfaces by Generating Broaches

shows one of the flat progressive broaches, the teeth of which have a rake of 15° which produces the rake angle of cut for the lateral cutting edges. The lateral cutting edges are placed at an angle of 60° relative to the broach base and have a ground back edge. The rake of 15° ensures a uniform distribution of the cutting stresses which creates favorable infeed conditions and reduces vibrations. The direction of rake was selected in such a way that the broach under the effect of the lateral composite broaching stress is pressed towards the body of the device. The broach has five cutting teeth of 0.1 mm lead and four calibrating teeth.

Card 3/5

The Broaching of Outer Surfaces by Generating Broaches

S/121/60/000/012/014/015
A004/A001

Figures 4 and 5 show the generating broaches for the machining of the curved surface of the component. The cutting scheme of the broaches has been selected in the following way: each tooth of the first and second broach has the profile of

Figure 5:

half a hexahedron, distance H from the center to the sides of which increases from tooth to tooth by 0.5 mm. The first broach removes thus four small sections of the cylindrical surface over the full depth of the allowance. The profile of the second broach relative to the profile of the first is shifted through 30° . In such a way the second broach cuts the sections located between the parts machined by the first broach. The broaches have a

long life. Since their introduction at the Plant more than 20,000 bearings of gray cast iron have been machined without re-grinding the broaches. Broaching is effected on a horizontal broaching machine with hydraulic drive. The maximum broaching stress amounts to 40 tons. The introduction of the new broaching process has reduced the labor consumption of machining the nine surfaces of the component by more than 4 times. There are 5 figures.

Measurement of Quick Changing Temperatures Applied
During Investigations of Unsteady Heat Exchange Processes 21

PERIODICAL:

Przegląd Mechaniczny, 1960, Nr 5, p 124 - 130

ABSTRACT:

For a complete evaluation of mechanical installations in which heat energy is being used, the accurate knowledge of the heat exchange process between hot flue-gases and the walls is of great importance. It allows to estimate the loss of hot gas energy for heating metal walls and for analysis of working conditions of walls in contact with hot flue-gases. The first problem, the heat exchange process is already well known, but the second, i.e. walls working conditions needs more scientific investigations in order to establish certain metal properties affected by high temperatures. If the process of

heat exchange is not steady or the walls are of a complicated shape, investigations are very difficult, sometimes even impossible. In such a case experimental investigations might be very helpful. This article deals just with a method which allows to investigate variable heat exchange between gases of high temperature, pressure and velocity either of short duration or repeating at intervals. The main element of investigation is an accurate measurement of metal temperature close to a spot where it contacts hot gases. This is done by a specially constructed thermo-electric feeler, fitted deep into the wall in such a way, that hot junction of thermocouple just about touches the hot side of the wall. Temperatures picked up by this feeler are registered either by a standard recorder or in case of very
